

# Getting Data

## Getting data from Discord:

You can get data regarding the discord server environment using parameters to the function when it is in a command decorator. [ `@commands.command()` ]

## Parameters:

- `Ctx`
  - Member -> discord.Member: This will give an object that contains data on the member that sent the message. This data can be accessed using the `.` character. Such as `member.roles` for a list of roles the member is enrolled in. The member can also be accessed using `ctx.author`.
